FX-PCG26 General Purpose Programmable Controller Installation Instructions

FX-PCG2611-x, FX-PCG2621-x

Part No. 24-10143-160, Rev. E Issued December 5, 2014

Refer to the QuickLIT website for the most up-to-date version of this document.

Application

The FX-PCG controller is part of the Facility Explorer
Programmable Controller (FX-PC) family. The FX-PCG
controller runs pre-engineered and user-programmed
applications and provides the inputs and outputs required
to monitor and control a wide variety of HVAC equipment.

The FX-PCG controllers operate on an RS-485 BACnet® Master-Slave/Token-Passing (MS/TP) Bus as BACnet Application Specific Controllers (B-ASCs) and integrate into Johnson Controls® and third-party BACnet systems.

The FX-PCG controller is available with or without an integral LCD and push-button user interface.

Switchable Communications Protocols

Release 10.1 of FX-PCT can be used to switch the Field Bus communications protocol in FX-PC Field Controllers so that they can act as either standard BACnet® Master-Slave/Token-Passing (MS/TP) devices or as N2 protocol devices. BACnet MS/TP is the default communications protocol for all new controllers. FX-PCT provides a cost-effective protocol upgrade path for existing customers that should be considered when you install the controller. The Modernization Guide for Legacy N2 Controllers (LIT-12012005) and the controller-specific documentation provide installation and commissioning support and include tips for efficient and safe replacement. Refer to the N2 Compatibility Options chapter of the Controller Tool Help (LIT-12011147) for information about mapping N2 Objects in controllers with switchable communications protocols.

The N2 capable FX-PC controllers can be used as functional replacements for legacy N2 controllers. The N2 capable FX-PC controllers:

- have the I/O quantities and characteristics of the FX-PC family controllers
- must be programmed with FX-PCT, which has programming capabilities that are similar (but not identical) to HVACPro, GX9100, GPL, and other legacy tools
- support SA Bus devices
- support FX-WRZ wireless sensors from the controller using the FX-WRZ7860 receiver when configured for BACnet MS/TP communication

The N2 capable FX-PC controllers:

- do not support Zone Bus (for example, TMZ sensors and M100 actuators) or XT-Bus (System 91) devices (for example, XT, XTM, and XP modules)
- · do not support passthru in the commissioning mode

North American Emissions Compliance

Canada

This Class (A) digital apparatus meets all the requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numérique de la Classe (A) respecte toutes les exigences du Règlement sur le matériel brouilleur du Canada.

United States

This equipment has been tested and found to comply with the limits for a Class A digital device pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when this equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area may cause harmful interference, in which case the users will be required to correct the interference at their own expense.

Installation

Observe these guidelines when installing an FX-PCG controller:

- Transport the controller in the original container to minimize vibration and shock damage.
- · Verify that all parts shipped with the controller.
- Do not drop the controller or subject it to physical shock.

Parts Included

- one FX-PCG controller with removable terminal blocks (Power, SA bus, and FC bus are removable)
- · one installation instructions sheet

Materials and Special Tools Needed

- three fasteners appropriate for the mounting surface (M4 screws or #8 screws)
- one 20 cm (8 in.) or longer piece of 35 mm DIN rail and appropriate hardware for DIN rail mount (only)
- small straight-blade screwdriver for securing wires in the terminal blocks

Mounting

Observe these guidelines when mounting an FX-PCG controller:

- Ensure the mounting surface can support the controller, DIN rail, and any user-supplied enclosure.
- Mount the controller horizontally on 35 mm DIN rail whenever possible.
- Mount the controller in the proper mounting position.
- Mount the controller on a hard, even surface whenever possible in wall-mount applications.
- Use shims or washers to mount the controller securely and evenly on the mounting surface.
- Mount the controller in an area free of corrosive vapors and observe the Ambient Conditions requirements in *Table 9*.
- Provide for sufficient space around the controller for cable and wire connections for easy cover removal and good ventilation through the controller (50 mm [2 in.] minimum on the top, bottom, and front of the controller).
- Do not mount the controller on surfaces prone to vibration, such as duct work.
- Do not mount the controller in areas where electromagnetic emissions from other devices or wiring can interfere with controller communication.

Observe these additional guidelines when mounting an FX-PCG controller in a panel or enclosure:

- Mount the controller so that the enclosure walls do not obstruct cover removal or ventilation through the controller.
- Mount the controller so that the power transformer and other devices do not radiate excessive heat to the controller.
- Do not install the controller in an airtight enclosure.

Figure 1: FX-PCG2621 Mounting Positions

Vertical Mount Position
Acceptable for Wall Mounting

DIN Rail Mount Applications

Mounting the FX-PCG horizontal on 35 mm DIN rail is the preferred mounting method.

To mount a controller on 35 mm DIN rail:

- Securely mount a 20 cm (8 in.) or longer section of 35 mm DIN rail horizontal and centered in the desired space so that the controller mounts in the horizontal position shown in *Figure 1*.
- 2. Pull the two bottom mounting clips outward from the controller to the extended position (*Figure 2*).
- Hang the controller on the DIN rail by the hooks at the top of the (DIN rail) channel on the back of the controller (*Figure 2*), and position the controller snugly against the DIN rail.
- Push the bottom mounting clips inward (up) to secure the controller on the DIN rail.

To remove the controller from the DIN rail, pull the bottom mounting clips out to the extended position and carefully lift the controller off the DIN rail.

Wall Mount Applications

To mount an FX-PCG directly on a wall or other flat vertical surface:

- 1. Pull the two bottom mounting clips outward and ensure they are locked in the extended position as shown in *Figure 2*.
- Mark the mounting hole locations on the wall using the dimensions in *Figure 2* and one of the mount positions shown in *Figure 1*. Or hold the controller up to the wall or surface in a proper mount position and mark the hole locations through the mounting clips.
- 3. Drill holes in the wall or surface at the marked locations, and insert appropriate wall anchors in the holes (if necessary).
- 4. Hold the controller in place, and insert the screws through the mounting clips and into the holes (or anchors). Carefully tighten all of the screws.

Important: Do not overtighten the mounting screws. Overtightening the screws may damage the mounting clips.

Figure 2: Back of Controller Showing Extended Mounting Clips, DIN Rail Channel, and Mounting Dimensions, mm (in.)

Figure 3: FX-PCG2621 Physical Features

Wiring

Observe the following guidelines when wiring a controller:

Risk of Electric Shock: Disconnect the power supply before making electrical connections to avoid electric shock.

Mise En Garde: Risque de décharge électrique: Débrancher l'alimentation avant de réaliser tout raccordement électrique afin d'éviter tout risque de décharge électrique.

Risk of Property Damage: Do not apply power to the system before checking all wiring connections. Short circuited or improperly connected wires may result in permanent damage to the equipment.

Mise En Garde: Risque de dégâts matériels: Ne pas mettre le système sous tension avant d'avoir vérifié tous les raccords de câblage. Des fils formant un court-circuit ou connectés de façon incorrecte risquent d'endommager irrémédiablement l'équipement.

Important: Do not exceed the controller electrical ratings. Exceeding controller electrical ratings can result in permanent damage to the controller and void any warranty.

Important: Use copper conductors only. Make all wiring in accordance with local, national, and regional regulations.

Important: Electrostatic discharge can damage controller components. Use proper electrostatic discharge precautions during installation, setup, and servicing to avoid damaging the controller.

For detailed information on configuring and wiring an MS/TP Bus, FC bus, and SA bus, refer to the FX-PC Series Controllers MS/TP Communications Bus Technical Bulletin (LIT-12011670) or MS/TP Communications Bus for BCM System Technical Bulletin (LIT-12011908).

Terminal Blocks and Bus Ports

See *Figure 3* for terminal block and bus port locations on the controller. Observe the following guidelines when wiring a controller.

Input and Output Terminal Blocks

All of the fixed input terminal blocks are mounted on the bottom of the controller and the output terminal blocks are mounted on the top of the controller. See *Table 2* for more information about I/O terminal functions, requirements, and ratings.

FC Bus Terminal Block

The FC Bus terminal block is a blue, removable, 4-terminal plug that fits into a board-mounted jack.

Wire the removable FC bus terminal block plugs on the controller, and other controllers in a daisy-chain configuration using 3-wire twisted, shielded cable as shown in *Figure 4*. See *Table 4* for more information.

Figure 4: FC Bus Terminal Block Wiring

Stranded 3-Wire Twisted Shielded Cable

Note: The FC bus Shield (SHLD) terminal is isolated and can be used to connect (daisy chain) the shields for FC bus wiring.

SA Bus Terminal Block

The SA Bus terminal block is a brown, removable, 4-terminal plug that fits into a board-mounted jack.

Wire the removable SA Bus terminal block plugs on the controller and other SA Bus devices in a daisy-chain configuration using 4-wire twisted, shielded cable as shown in *Figure 5*. See *Table 4* for more information.

Figure 5: SA Bus Terminal Block Wiring

Stranded, 4-Wire (2 Twisted Pair) Shielded Cable (One twisted pair is the + and - leads.

The second pair is COM and SA PWR.)

Note: The SA PWR terminal supplies 15 VDC. The SA PWR terminal can be used to connect (daisy chain) the 15 VDC power leads on the SA bus.

FC Bus Port

The FC bus port on the front of the controller is an RJ-12, 6-position modular jack that provides a connection for the FX-BTCVT Bluetooth® Commissioning Converter, ZFR-USBHA-0 ZigBee™ wireless dongle, or FX-ZFR1811 Wireless Field Bus Router.

The FC bus port is connected internally to the FC bus terminal block. See *Table 4* for more information. The FC bus Port pin assignment is shown in *Figure 6*.

Figure 6: Pin Number Assignments for Sensor, SA Bus, and FC Bus Ports on Controllers

Sensor Port

The Sensor (SA Bus) port on the bottom of the controller (*Figure 3*) is an RJ-12, 6-position modular jack that provides a connection for the Bluetooth Commissioning Converter, the VAV Balancing Tool, specified network sensors, or other SA Bus devices with RJ-12 plugs.

An FX-DIS Local Controller Display also can be connected to the SA Bus port (but only on FX-PCG models without integral display and push buttons).

The Sensor port is connected internally to the SA bus terminal block. See *Table 4* for more information. The Sensor Port pin assignment is shown in *Figure 6*.

Supply Power Terminal Block

The 24 VAC supply power terminal block is a gray, removable, 3-terminal plug that fits into a board-mounted jack on the top right of the controller.

Wire the 24 VAC supply power wires from the transformer to the HOT and COM terminals on the terminal plug as shown in *Figure 7*. The middle terminal on the supply power terminal block is not used. See *Table 4* for more information about the Supply Terminal Block.

Figure 7: 24 VAC Supply Power Terminal Block Wiring

Disconnect supply power to controller by unplugging Supply Power Plug from Supply Power Jack.

Note: The supply power wire colors may be different on transformers from other manufacturers. Refer to the transformer manufacturer's instructions and the project installation drawings for wiring details.

Important: Connect 24 VAC supply power to the controller and all other network devices so that transformer phasing is uniform across the network devices. Powering network devices with uniform 24 VAC supply power phasing reduces noise, interference, and ground loop problems. The FX-PCG does not require an earth ground connection.

Wireless Network Applications

The controller can also be installed in a wireless application using an FX-ZFR Wireless Field Bus Router.

To configure a controller for use with the FX-ZFR Series Wireless Field Bus system:

1. Wire the input/output terminals and SA bus.

Note: In wireless network applications, do not connect any wires to the FC bus terminal block. (Connect the SA/FC terminal block on a PCX to an SA bus only.)

- Connect the FX-ZFR1811 Wireless Field Bus Router to the FC bus port (RJ-12 modular jack) on the front of the controller.
- Ensure that the controller's device address DIP switches are set to the correct device address. See Setting the Device Addresses.
- 4. Set DIP switch 128 to ON, which enables wireless operation on the FX-PCG.

For more information on installing a controller in a wireless configuration, refer to the FX-ZFR1811 Wireless Field Bus Router Installation Instructions (Part No. 24-10325-29).

Termination Details

A set of Johnson Controls® termination diagrams provides details for wiring inputs and outputs to the controllers. See the figures in this section for the applicable termination diagrams.

Terminal Wiring Guidelines, Functions, Ratings, and Requirements

Input and Output Wiring Guidelines

Table 2 provides information and guidelines about the functions, ratings, and requirements for the controller input and output terminals; and references guidelines for determining proper wire sizes and cable lengths.

In addition to the wiring guidelines in *Table 2*, observe these guidelines when wiring controller inputs and outputs:

- Run all low-voltage wiring and cables separate from high-voltage wiring.
- All input and output cables, regardless of wire size or number of wires, should consist of stranded, insulated, and twisted copper wires.
- Shielded cable is not required for input or output cables.
- Shielded cable is recommended for input and output cables that are exposed to high electromagnetic or radio frequency noise.
- Inputs/outputs with cables less than 30 m (100 ft) typically do not require an offset in the software setup.
 Cable runs over 30 m (100 ft) may require an offset in the input/output software setup.

Table 2: FX-PCG26 Terminal Blocks, Functions, Ratings, Requirements, and Cables

Terminal Block Label	Terminal Label	Function, Ratings, Requirements	Determine Wire Size and Maximum Cable Length	
UNIVERSAL	+15 V	15 VDC Power Source for active (3-wire) input devices connected to the Universal IN <i>n</i> terminals.	Same as (Universal) IN n	
(Inputs)		Provides 100 mA total current	Note: Use 3-wire cable for devices that source power from the +15V terminal.	
	INn	Analog Input - Voltage Mode (0-10 VDC)	See Guideline A in Table 3.	
		10 VDC maximum input voltage		
		Internal 75k ohms Pull-down		
		Analog Input - Current Mode (4–20 mA)	See Guideline B in <i>Table 3</i> .	
		Internal 100 ohms load impedance		
		Note: A current loop fail-safe jumper can be positioned to maintain a closed 4 to 20 mA current loop, even when the power to the controller is interrupted or off. See the <i>Universal Input Current Loop Jumpers</i> section.		
		Analog Input - Resistive Mode (0–600k ohms)	See Guideline A in <i>Table 3</i> .	
		Internal 12 V. 15k ohms pull up		
		Qualified Sensors: 0-2k ohms potentiometer, RTD (1k Nickel [Johnson Controls® sensor], 1k Platinum, and A99B Silicon Temperature Sensor) Negative Temperature Coefficient (NTC) Sensor (10k Type L, 10k JCl Type II, 2.252k Type II)		
		Binary Input - Dry Contact Maintained Mode	See Guideline A in Table 3.	
		1 second minimum pulse width		
		Internal 12 V. 15k ohms pull up		
	ICOMn	Universal Input Common for all Universal Input terminals	Same as (Universal) INn	
		Note: All Universal ICOM <i>n</i> terminals share a common, which is isolated from all other commons.		
BINARY	IN n	Binary Input - Dry Contact Maintained Mode	See Guideline A in Table 3.	
(Inputs)		0.01 second minimum pulse width		
		Internal 18 V. 3k ohms pull up		
		Binary Input - Pulse Counter/Accumulator Mode		
		0.01 second minimum pulse width		
		(50 Hz at 50% duty cycle)		
		Internal 18 V. 3k ohms pull up		
	ICOMn	Binary Input Common for all Binary Input (IN) terminals		
		Note: All Binary ICOMn terminals share a common, which is isolated from all other commons, except the Configurable Output (CO) common (OCOMn) when the CO is defined as an Analog Output.		

Table 2: FX-PCG26 Terminal Blocks, Functions, Ratings, Requirements, and Cables

Terminal Block Label	Terminal Label	Function, Ratings, Requirements	Determine Wire Size and Maximum Cable Length
ANALOG	OUT n	Analog Output - Voltage Mode (0–10 VDC)	See Guideline C in Table 3.
(Outputs)		10 VDC maximum output voltage	
		10 mA maximum output current	
		Required an external load of 1,000 ohms or more.	
		Note: The Analog Output (AO) operates in the Voltage Mode when connected to devices with impedances greater than 1,000 ohms. Devices that drop below 1,000 ohms may not operate as intended for Voltage Mode applications.	
		Analog Output - Current Mode (4–20 mA)]
		Requires and external load between 0 and 300 ohms.	
		Note: The Analog Output (AO) operates in the Current Mode when connected to devices with impedances less than 300 ohms. Devices that fall below 300 ohms may not operate as intended for Current Mode applications.	
	OCOM n	Analog Output Signal Common for all Analog OUT terminals.	
		Note: All Analog Output Common terminals (OCOM <i>n</i>) share a common, which is isolated from all other commons.	
BINARY	OUT n	Binary Output - 24 VAC Triac (External Power Source)	See Guideline C in <i>Table 3</i> .
(Output)		Connects OUTn to OCOMn when activated.	
Power Selection		External Power Source Requirements:	
Jumper positioned to External (EXT) power.		30 VAC maximum output voltage	
, , ,		0.5 A maximum output current	
		1.3 A at 25% duty cycle	
		40 mA minimum load current	
	OCOM n	Binary Output Common (for OUT <i>n</i> terminal)	
		Note: Each Binary Output Common terminal (OCOMn) is isolated from all other commons, including other Binary Output Common terminals.	
BINARY	OUT n	Binary Output - 24 VAC Triac (Internal Power Source)	See Guideline C in <i>Table 3</i> .
(Output)		Sources internal 24 VAC power (24~ HOT).]
Power Selection	OCOM n	Binary Output - 24 VAC Triac (Internal Power Source)	
Jumper positioned to Internal (INT) power.		Connects OCOMn to 24~ when activated.	
		Internal Power Source:	
		30 VAC maximum output voltage	
		0.5 A maximum output current	
		1.3 A at 25% duty cycle	
		40 mA minimum load current	

Table 2: FX-PCG26 Terminal Blocks, Functions, Ratings, Requirements, and Cables

Terminal Block Label	Terminal Label	Function, Ratings, Requirements	Determine Wire Size and Maximum Cable Length
CONFIGURABLE	OUT n	Analog Output - Voltage Mode (0–10 VDC)	See Guideline A in <i>Table 3</i> .
(Outputs)		10 VDC maximum output voltage	
		10 mA maximum output current	
		Required an external load of 1,000 ohms or more.	
		Binary Output - 24 VAC Triac (External Power Source only)	See Guideline C in Table 3.
		Connects OUTn to OCOMn when activated.	
		External Power Source Requirements:	
		30 VAC maximum output voltage	
		0.5 A maximum output current	
		1.3 A at 25% duty cycle	
		40 mA minimum load current	
	OCOM n	Analog Output Signal Common All Configurable Outputs (COs) defined as Analog Outputs (AOs) share a common, which is isolated from all other commons except the Binary Input common.	
		Binary Output Signal Common All Configurable Outputs (COs) defined as Binary Outputs are isolated from all other commons, including other CO commons.	

Cable and Wire Length Guidelines

Table 3 defines cable length guidelines for the various wire sizes that may be used for wiring low-voltage (<30V) input and outputs.

Table 3: Cable Length Guidelines for Recommended Wire Sizes for Low-Voltage (<30V) Inputs and Outputs

Guideline	Wire Size/Gauge and Type	Maximum Cable Length and Type	Assumptions
A	1.5 mm ² (18 AWG) stranded copper	457 m (1,500 ft) twisted wire	100 mV maximum voltage drop Depending on cable and the connected input
	0.8 mm (20 AWG) stranded copper	297 m (975 ft) twisted wire	or output device, you may have to define an
	0.6 mm (22 AWG) stranded copper	183 m (600 ft) twisted wire	offset in the setup software for the input or output point.
	N/A (24 AWG) stranded copper	107 m (350 ft) twisted wire	output point.
В	1.5 mm ² (18 AWG) stranded copper	229 m (750 ft) twisted wire	100 mV maximum voltage drop
	0.8 mm (20 AWG) stranded copper	137 m (450 ft) twisted wire	Depending on cable and the connected input
	0.6 mm (22 AWG) stranded copper	91 m (300 ft) twisted wire	or output device, you may have to define an offset in the setup software for the input or
	N/A (24 AWG) stranded copper	61 m (200 ft) twisted wire	output point.
С	See <i>Figure 8</i> to select wire size/gauge. Use stranded copper wire	See <i>Figure 8</i> to determine cable length. Use twisted wire cable.	N/A

Maximum Cable Length versus Load Current

Note: Figure 8 applies to low-voltage (<30V) inputs and outputs only.

Use *Figure 8* to estimate the maximum cable length relative to the wire size and the load current (in mA) when wiring inputs and outputs.

Figure 8: Maximum Wire Length for Low-Voltage (<30V) Inputs and Outputs by Current and Wire Size

SA/FC Bus and Supply Power Wiring Guidelines

Table 4 provides information about the functions, ratings, and requirements for the communication bus and supply power terminals; and guidelines for wire sizes, cable types, and cable lengths when wiring the controller's communication buses and supply power.

In addition to the guidelines in *Table 4*, observe these guidelines when wiring an SA or FC bus and the 24 VAC supply power:

- Run all low-voltage wiring and cables separate from high-voltage wiring.
- All SA and FC bus cables, regardless of wire size, should be twisted, insulated, stranded copper wire.
- Shielded cable is strongly recommended for all SA and FC bus cables.
- Refer to the FX-PC Series Controllers MS/TP
 Communications Bus Technical Bulletin
 (LIT-12011670) or MS/TP Communications Bus for
 BCM System Technical Bulletin (LIT-12011908) for
 detailed information regarding wire size and cable
 length requirements for the SA and FC buses.

Table 4: Communications Bus and Supply Power Terminal Blocks, Functions, Ratings, Requirements, and Cables

Terminal Block/Port Label	Terminal Labels	Function, Electrical Ratings/Requirements	Recommended Cable Type	
FC BUS ¹	+	FC Bus Communications	0.6 mm (22 AWG) stranded, 3-wire twisted, shielded cable recommended	
	СОМ	Signal Reference (Common) for Bus communications	7	
	SHLD	Isolated terminal (optional shield drain connection)		
FC BUS ¹	or	RJ-12 6-Position Modular Connector provides: FC Bus Communications	Bluetooth Commissioning Converter retractable cable or 24 AWG 3-pair	
(Port)		FC Bus Signal Reference and 15 VDC Common 15 VDC, 180 mA, Power for Bluetooth Commissioning Converter or FX-ZFR1811 Wireless Router	CAT 3 Cable <30.5 m (100 ft)	
SA BUS ¹	+	SA Bus Communications	0.6 mm (22 AWG) stranded, 4-wire (2 twisted-pairs), shielded cable recommended.	
	СОМ	SA Bus Signal Reference and 15 VDC Common	Note: The + and - wire are one	
	SA PWR	15 VDC Supply Power for Devices on the SA Bus	twisted pair, and the COM	
		(Maximum total current draw for SA Bus is 240 mA.)	and SA PWR are the second twisted pair of wires.	
Sensor ¹	Sensor	RJ-12 6-Position Modular Connector provides: SA Bus Communications SA Bus Signal Reference and 15 VDC Common	24 AWG 3-pair CAT3 cable <30.5 m (100 ft)	
		15 VDC Power for devices on the SA bus and Wireless Commissioning Converter		

Table 4: Communications Bus and Supply Power Terminal Blocks, Functions, Ratings, Requirements, and Cables

Terminal Block/Port Label	Terminal Labels	Function, Electrical Ratings/Requirements	Recommended Cable Type
24~	НОТ	24 VAC Power Supply - Hot	0.8 mm to 1.5 mm ²
		Supplies 20–30 VAC (Nominal 24 VAC)	(18 AWG) 2-wire
	СОМ	24 VAC Power Supply Common (Isolated from all other Common terminals on controller) 35 VA	

¹ The SA Bus and FC Bus wiring recommendations in this table are for MS/TP bus communications at 38.4k baud. For more information, refer to the FX-PC Series Controllers MS/TP Communications Bus Technical Bulletin (LIT-12011670) or MS/TP Communications Bus for BCM System Technical Bulletin (LIT-12011908).

Setup and Adjustments

Setting the Device Addresses

FX-PC Series controllers are master devices on MS/TP (SA or FC) buses. Before operating FX-PCG controllers on a bus, you **must** set a valid and unique device address for each controller on the bus. You set a controller's device address by setting the positions of the switches on the DIP switch block at the top of the controller (*Figure* 3). Device addresses 4 through 127 are the valid addresses for these controllers.

The DIP switch block has eight switches numbered 128, 64, 32, 16, 8, 4, 2, and 1 (*Figure 9*). Switches 64 through 1 are device address switches. Switch 128 is a mode switch that enables a controller to operate on an FX-ZFR Series Wireless Field Bus. Switch 128 must be set to off for all hard-wired SA and FC bus applications. Set switch 128 to ON for wireless FC bus applications **only**.

Figure 9: Device Address DIP Switch Block Set to Address 21

Note: Switch 128 is used to enable or disable a controller for wireless operation.

Note: FX-PCGs ship with switch 128 ON and the remaining address switches off rendering the controllers wired slave devices, which do not operate on MS/TP buses, but will not interfere with bus operation. Set a valid and unique device address on the controller before applying power to the controller on the bus.

- 1. Set **all** of the switches on the address DIP switch block (128 through 1) to off.
- Set one or more of the seven address switches (64 though 1) to ON, so that the sum of the switch numbers set to ON equals the intended device address. See *Table 5*.

Set the highest number switch that is less than or equal to the intended device address to ON. Then continue setting lower numbered switches until the total equals the intended address. For example, if the intended device address is 21, set switch 16 to ON first, then set switch 4 ON, followed by switch 1 (16+4+1= 21). See *Figure* 9.

3. Set switch 128 to ON **only** for controllers on an FX-ZFR Series Wireless Field Bus application. For all hard-wired SA and FC bus applications, ensure that switch 128 is set to Off.

Note: Do not connect a controller with switch 128 set to ON to an active (hard-wired) SA or FC bus. When a controller with switch 128 set to ON and a device address from 4 to 127 is connected to a wired field bus, the entire field bus is rendered inoperable until the controller is disconnected or switch 128 is set to Off.

Refer to the FX-ZFR Series Wireless Field Bus System Technical Bulletin (LIT-12011660) for more information on device addresses in wireless applications.

 Set a unique and sequential device address for each of the controllers connected on the SA or FC bus starting with device address 4.

To ensure the best bus performance, set sequential device addresses with no gaps in the device address range (4, 5, 6, 7, 8, 9, and so on). The controllers do **not** need to be physically connected on the bus in their numerical device address order.

Write each FX-PCG's device address on the white label below the DIP switch block on the controller's cover.

Table 5 describes the FC bus and SA bus devices addresses for Johnson Controls® MS/TP communications bus applications.

Refer to the FX-PC Series Controllers MS/TP Communications Bus Technical Bulletin (LIT-12011670) or MS/TP Communications Bus for BCM System Technical Bulletin (LIT-12011908) for more information on controller device addresses and how to set them on MS/TP buses.

Table 5: SA/FC Bus Device Address Descriptions

Device Address	Use on Description	
0 (Switch 128 Off)	Reserved for FC Bus Supervisory Controller (not for use on FX-PC controllers).	
1 to 3 (Switch 128 Off)	Reserved for peripheral devices (not for use on FX-PC controllers).	
4 to 127 (Switch 128 Off)	Used for MS/TP master devices (FX-PC) that are hardwired to an SA Bus or FC Bus.	
0 to 3 (Switch 128 ON)	Reserved addresses for wired slave devices (not for use on FX-PC controllers). Note: FX-PCGs ship with switch 128 ON and the remaining address switches off rendering the controllers wired slave devices, which do not operate on MS/TP buses.	
4 to 127 (Switch 128 ON)	Valid for MS/TP Master controllers on wireless FC Buses only. Note: Do not connect an FX-PC controller with switch 128 ON to an active (hard-wired) SA or FC Bus. When a controller with switch 128 ON and a device address from 4 to 127 is connected to a wired field bus, the entire field bus is rendered inoperable until the controller is disconnected or switch 128 is set to off.	

Setting the N2 Controller Address to be Greater than 127

N2-configured controllers support the full range of possible N2 device addresses provided by the N2 protocol standard (1-255). However, these controllers require special configuration for addresses above 127.

Use the following instructions for controllers greater than 127.

Note: Before you perform this procedure, make sure that your controller has been converted from BACnet to N2 protocol first. Refer to the *Modernization Guide for Legacy N2 Controllers* (LIT-12012005) for more information.

Note: This special configuration is required because controller addresses above 127 were originally intended for use with the Wireless Field Bus system.

- 1. Disconnect the 24 VAC supply from the controller.
- Remove the FC Bus connector from the controller.
- 3. Set the address switch set to the desired N2 address.
- 4. Set the address switch segment labeled 128 to OFF.
- Reconnect the 24 VAC supply to the controller.
- Using an FX-PCT tool connection at the FX-PC controller's SA bus, download the firmware and controller application file. The download process asks to confirm switching the communication protocol to N2.
- 7. Click OK.
- 8. After the download is finished, disconnect the 24 VAC supply to the FX-PC controller.
- 9. Set the address switch segment labeled 128 to ON.
- Reattach the FC Bus connector to the FX-PC controller.
- Reconnect the 24 VAC supply to the FX-PC controller.

Removing the Controller Cover

Important: Electrostatic discharge can damage controller components. Use proper electrostatic discharge precautions during installation, setup, and servicing to avoid damaging the controller.

Important: Disconnect all power sources to the controller before removing cover and changing the position of any jumper or the EOL switch on the controller. Failure to disconnect power before changing a jumper or EOL switch position can result in damage to the controller and void any warranties.

The controller cover is held in place by four plastic latches that extend from the base and snap into slots on the inside of the housing cover.

To remove the controller cover:

- 1. Place your fingernails under the two cover lift tabs (*Figure 3*) on the sides of the housing cover and gently pry the top of the cover away from the base to release the cover from the two upper latches.
- 2. Pivot the top of the cover further to release it from the lower two latches.
- 3. Replace the cover by placing it squarely over the base, and then gently and evenly push the cover on to the latches until they snap into the latched position.

Figure 10: FX-PCG26 with Cover Removed Showing EOL Switch and Jumper Positions

Setting the End-of-Line (EOL) Switch

Each controller has an EOL switch, which, when set to ON, sets the controller as a terminating device on the bus. See *Figure 10* for the EOL switch location. The default EOL switch position is Off.

Figure 11: End-of-Line Switch Positions

To set the EOL switch on an FX-PCG:

- Determine the physical location of the controller on the FC bus.
- 2. Determine if the controller must be set as a terminating device on the bus.

Note: Refer to the FX-PC Series Controllers MS/TP Communications Bus Technical Bulletin (LIT-12011670) or MS/TP Communications Bus for BCM System Technical Bulletin (LIT-12011908) for detailed information regarding EOL termination rules and EOL switch settings on FC buses.

 If the controller is a terminating device on the FC bus, set the EOL switch to ON. If the controller is not a terminating device on the bus, set the EOL switch to Off.

When an FX-PCG is connected to power with its EOL switch set to ON, the amber EOL LED on the controller cover is lit.

Setting the Input and Output Jumpers

Binary Output (BO) Source Power Selection Jumpers

Risk of Electric Shock: Disconnect supply power to the FX-PCG before attempting to adjust the Binary Output Source Power Selection Jumpers. Failure to disconnect the supply power may result in electric shock.

Mise En Garde: Risque de décharge électrique: Débrancher l'alimentation de l'controller avant tout réglage du Binary Output Source Power Selection Jumpers. Le non-respect de cette précaution risque de provoguer une décharge électrique. Important: Do not connect an external power source to a BO when the BO power source jumper is in the internal power (INT) position.

Connecting external power to a BO that sources internal power can damage the controller and void any warranties.

The BO source power selection jumpers determine whether a BO provides internal power (sourced from the controller) to the output load (INT position) or requires an external power source (EXT position) for the output load. *Figure 12* shows an example of a controller BOs and the associated power selection jumpers to the right of the BOs terminal block.

Figure 12: Example Binary Outputs and the Associated Source Power Jumper Positions

Universal Input Current Loop Jumpers

The Universal Input (UI) current loop fail-safe jumpers are on the circuit board under the controller cover near the UI terminals (*Figure 10*). When a UI is defined (in the system software) as a 4-20 mA Analog Input and the UI's current loop jumper is in the Disabled (default) position (*Figure 13*), the 4-20 mA current loop circuit opens whenever power to the controller is interrupted or off.

Figure 13: Current Loop Jumper Positions

Setting the current loop jumper to the Enabled position (*Figure 13*) connects an internal 100 ohm resistor across the UI terminals, which maintains the 4-20 mA current loop circuit even when power to the controller is interrupted or off.

Important:	Current Loop jumpers must be in the
	Disabled (default) position for all UIs that
	are not set up to operate as 4-20 mA analog
	inputs.

Table 6 identifies the current loop jumpers associated with each UI on the FX-PCG26.

Table 6: FX-PCG26 UI Inputs and Jumper Labels

Universal Input Label	Jumper Label on Circuit Board
IN1	J20
IN2	J21
IN3	J22
IN4	J23
IN5	J24
IN6	J25

Setting Up an Integral or Local Display

FX-PCG262x models have an integral LCD and pushbutton user interface that allows you to set up and monitor the FX-PCG, the FX-PCG I/O points, and the modules and I/O points connected on the SA bus. FX-PCG261x models do not have an integral display, but can be connected to an FX-DIS1710 Local Controller Display. For detailed information on setting up and operating either an integral user interface or a remotely connected FX-DIS1710 display, refer to the FX-DIS1710 Local Controller Display Technical Bulletin (LIT-12011666).

Commissioning FX-PCG Controllers

You commission FX-PCG controllers with the PCT software, via a Bluetooth® Wireless Commissioning Converter, a USB dongle with ZigBee®, Ethernet connection, or in BACnet router mode when connected to an FX Supervisory Controller. Refer to the *Controller Tool Help (LIT-12011147)* for detailed information on commissioning controllers.

Troubleshooting FX-PCG Controllers

Observe the Status LEDs on the front of the FX-PCG and see *Table 7* to troubleshoot the controller. To troubleshoot an integral or local controller display, refer to the *FX-DIS1710 Local Controller Display Technical Bulletin (LIT-12011666)*.

Table 7: Status LEDs and Descriptions of LED States

LED Label	LED Color	Normal LED State	Description of LED States
POWER	Green	On Steady	Off Steady = No Supply Power or the controller's polyswitch/resettable fuse is open. Check Output wiring for short circuits and cycle power to controller.
			On Steady = Power Connected
FAULT	Red	Off Steady	Off Steady = No Faults
			On Steady = Device Fault; no application loaded; Main Code download required, if controller is in Boot mode, or a firmware mismatch exists between the FX-PCG and the FX-ZFR1811 Wireless Field Bus Router.
			Blink - 2 Hz = Download or Startup in progress, not ready for normal operation
SA BUS	Green	Blink - 2 Hz	Blink - 2 Hz = Data Transmission (normal communication)
			Off Steady = No Data Transmission (N/A - auto baud not supported)
			On Steady = Communication lost, waiting to join communication ring
FC BUS	Green	Blink - 2 Hz	Blink - 2 Hz = Data Transmission (normal communication)
			Off Steady = No Data Transmission (auto baud in progress)
			On Steady = Communication lost, waiting to join communication ring
EOL	Amber	Off (Except on	On Steady = EOL switch in ON position
		terminating devices)	Off Steady = EOL switch in Off position

Repair Information

Accessories

If a controller fails to operate within its specifications, replace the controller. For a replacement controller, contact your Johnson Controls® representative.

See *Table 8* for controller accessories ordering information.

Table 8: Accessories Ordering Information

Product Code Number	Description	
FX-BTCVT-1	Bluetooth Commissioning Converter	
FX-DIS1710-0	Local Controller Display (for use with FX-PCG2611 model only)	
FX-ZFR1811-0	Wireless Field Bus Router	
TP-2420	Transformer, 120 VAC Primary to 24 VAC secondary, 20 VA, Wall Plug	
Y65T31-0	Transformer, 120/208/240 VAC Primary to 24 VAC Secondary, 40 VA, Foot Mount, 8 in. Primary Leads and Secondary Screw Terminals, Class 2	
	Note: Additional Y6x-x Series transformers are also available. Refer to the <i>Series Y63</i> , Y64, Y65, Y66, and Y69 Transformers Product Bulletin (LIT-125755) for more information.	
AS-XFR050-0	Power transformer (Class 2, 24 VAC, 50 VA maximum output), no enclosure	
AP-TBK4SA-0	Replacement SA Bus Terminal Blocks, 4-Position, Brown, Bulk Pack	
AP-TBK4FC-0	Replacement FC Bus Terminal Blocks, 4-Position, Blue, Bulk Pack	

Table 8: Accessories Ordering Information

Product Code Number	Description
AP-TBK3PW-0	Replacement Power Terminal Blocks, 3-Position, Gray, Bulk Pack
ZFR-USBHA-0	USB Dongle with ZigBee® Driver provides a wireless connection through FX-PCT to allow wireless commissioning of the wirelessly enabled FX-PCG, FX-PCA, FX-PCX, and FX-PCV field controllers. Also allows use of the FX-ZFR Checkout Tool (FX-ZCT) in FX-PCT. Note: The ZFR-USBHA-0 replaces the IA OEM DAUBI_2400 ZigBee USB dongle. For additional information on the ZFR-USBHA-0 ZigBee dongle, refer to the FX-ZFR Series Wireless Field Bus System Technical Bulletin (LIT-12011660) or FX-ZFR Series Wireless Field Bus System Quick Reference Guide (LIT-12011696).
